

TIDE MACHINE — FACEPLATE

Material 1.5 mm sheet, aluminium or mild steel. 321 × 164 mm. Deburr both faces; no finish required.

Origin (0, 0) is the M2 motor shaft. y = 0 is the crank centreline, shared by all five stations.

Holes 5 × Ø10.0 shaft clearance 10 × Ø3.2 motor M3 (35 PCD, on y = 0)
10 × Ø3.2 sensor-bracket M3 10 × Ø4.0 frame screw, #6 clearance, on y = ±76

Asymmetric the station pattern is not centred — a mirrored plate is scrap. M2 end on the left, front face up.

PRINT AT 100% / ACTUAL SIZE. Any "fit to page" or "shrink to printable area" destroys the 1:1 scale.

Sheets 2–3 are the plate at 1:1, split into two tiles with a 30 mm overlap.

Print both at 100%, trim sheet 3 on its red registration line, and tape it over the matching line on sheet 2.

Then measure the 100 mm bar on BOTH sheets before marking anything.

FACEPLATE 1:1 TILE 1 of 2 x -156 to +34 mm print at 100%, do not scale
